

Gate Assort System in pursuit of zero mistake.

“People make the mistakes”, we have created the GAS (Gate Assort System) in pursuit of “zero error” in assorting goods.

Base on the premise, “People make the mistakes”, we have created the GAS (Gate Assort System) in pursuit of “zero error” in assorting goods. Due to the installation cost, space and fixed equipment required, it is difficult to achieve ROI (return on investment) in the short term. Productivity and maintainability are not regulated by heavily inspecting the trucks. Evening utilizing digital display, mistakes could still occur when goods are being inserted into the top and the bottom, or left and right shelves . In order for the goods to be physically possible to be inserted , the “OK Logic” is required. The GAS is a revolutionary system which excludes human error which is designed as the “NO Logic”. GAS only allows goods to be inserted in vacant gates by setting the gate at the front end of each shelf.

Feature of Gate assort system

Simply guidance display

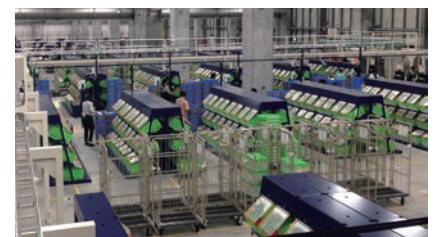

① Product scan

② If repeat the product scan, the gate will open until denominator is up to the quantity.

③ After inputting the goods, press the foot switch.
